<http://www.technobridge.in/clinical-research-course.html>

1. Clinical Research Associate (CRA): A clinical research associate is one who performs activities connected to clinical trials. These health care professionals are an integral part of the Clinical Research industry after completing the required courses in clinical resources. These professionals find opportunities in various organizations namely pharmaceutical companies, medical research institutes and government agencies

2. Clinical Research Coordinator: A clinical research coordinator, also known as a clinical trial manager plays an important role in various medical studies. They usually work under the guidance of the principal investigator who takes charge of designing, conducting and managing a clinical trial from the topmost level. Along with that, it is the CRC's job to support, facilitate and organize routine clinical trial activities. Clinical Research coordinators also collaborate with the department, sponsor and institutions to guide

them through compliance, finances and personnel issues. In layman's language, the CRC manages the daily clinical operation activities, overseeing and executing delegated tasks to the respective parties

3. Clinical research Manager

A clinical research Manager is a professional who supervises designing and writing of protocols, case report forms for clinical trials. Apart from this they also make sure that the Particular Case report Forms are reviewed and well-timed so that they can be sent forward to the respective data management groups.

Apart from these opportunities, aspirants would have access to alternative career opportunities after completing a course in clinical research. There are different job profiles related to the field of medical research. They could work as medical assistants in hospitals, clinics or doctor's offices. Their main responsibility would be that of meeting patients, recording their medical history, keeping a track of their symptoms, administering medicine and collaborating with the doctor with respect to these patients. Additionally, these professionals take charge of a range of administrative and executive tasks in the respective hospital or clinic.

In summation, the field of clinical research provides a plethora of options for medical aspirants once they complete a course in clinical research. With the required training provided by training institutes and firms, the experienced individual will secure a job in various organizations.
